To: Lawrence Baynham <lbaynham@indolighting.com>

Lawrence,

The devices we sent you for testing were configured with code designed to run the CPU/GPU at their maximum power draw. As such the power that you calculate will be the maximum power draw.

For our current clients, the sensors will always be in this maximum power mode, and as a result, please request Elexon use the power you calculate to generate the charge code.

For future clients who are more sensitive to the power draw, we can throttle the code that is running. This produces a more coarse data set, but at a lower power level. If we sell a project with such a requirement, we will get a new charge code generated for this set up.

Regards,

Peter Mildon
COO
